

Global Frequency Warning System

The Global Frequency Warning (GFW) system is a short-range radio re-broadcast system designed to provide automatic, accurate and immediate messages to people at most risk.

Meeting Early Warning System Needs

- Rapid notification to those most in most need
- Broadcast relevant information and instructions
- Wide area of coverage possible
- Catastrophic event management and response
- Can be activated from central management point
- Mobile application for rapid response
- Fixed application for coverage of isolated areas
- Can be automatically activated for rapid notification

Patented Technology WORLD LEADERSHIP

Catastrophic Events - Terrorism

Disasters arising from major crime scenes such as terrorist attacks are a growing threat affecting many people throughout the world. How do you quickly warn the public about a danger and give them the vital instructions that they need to improve their safety and minimize the use of emergency personnel?

In the unfortunate event of an attack people in local areas need to receive meaningful warnings, quickly, effectively and, if required, automatically.

The dissemination of emergency warnings, that can be immediately acted upon, can substantially reduce casualties and loss of life.

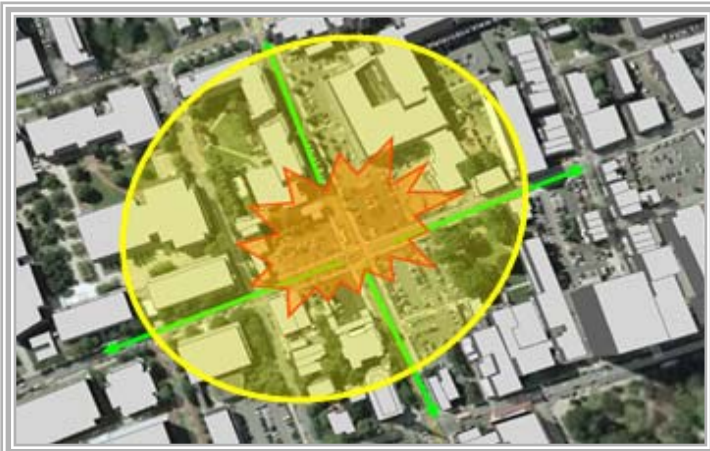

Terrorist Attack - Variable Coverage Messaging

GFW Solution for Dissemination and Communication After an Attack

Emergency Warning Systems Pty Ltd has a solution which could improve one of the most fundamental components of the emergency response equation - the dissemination, in a timely manner, of meaningful warnings to those at risk. The GFW (fixed or mobile application) is a broadcast emergency warning system that over-broadcasts on existing radio frequencies over a specified distance to provide information relevant to the area under attack. The message to be broadcast is user defined which includes accurate information and instructions. The GFW can be integrated with existing infrastructure or be controlled as a stand alone mobile unit.

The GFW is the only solution WORLD WIDE that provides the ability to nominate/exclude frequencies, measure radio signal strength and determine accurate transmission coverage based on real-time sampling of existing frequencies in the area - a critical factor to ensure there is minimal unnecessary disruption.

All the public require is a standard radio. All you need is a GFW.

Terrorist Attack - Dissemination of Warning and Evacuation Response.
